Problem Statement

Write a program to count the number of days between two dates.

The two dates are given as strings, their format is YYYY-MM-DD as shown in the examples.

Program:

```
import java.time.LocalDate;
import java.time.temporal.ChronoUnit;

class Solution {
    public int daysBetweenDates(String date1, String date2) {
        LocalDate d1 = LocalDate.parse(date1);
        LocalDate d2 = LocalDate.parse(date2);

        long days = ChronoUnit.DAYS.between(d1, d2);
        return (int) Math.abs(days);
    }
}

public class Main {
    public static void main(String[] args) {
        Solution sol = new Solution();

        // Example 1
        String date1 = "2019-06-29";
        String date2 = "2019-06-30";
        System.out.println(sol.daysBetweenDates(date1, date2)); // Output: 1

        // Example 2
        String date3 = "2020-01-15";
        String date4 = "2019-12-31";
        System.out.println(sol.daysBetweenDates(date3, date4)); // Output: 15
    }
```

}

Input: date1 = "2019-06-29", date2 = "2019-06-30"

Output: 1

Input: date1 = "2020-01-15", date2 = "2019-12-31"

Output: 15
