Problem statement:

Given a list of non-negative integers nums, arrange them such that they form the largest number and return it.

Since the result may be very large, so you need to return a string instead of an integer.

Program:

```
import java.util.*;

class Solution {
  public String largestNumber(int[] nums) {
    // Convert integers to strings
    String[] strNums = new String[nums.length];
    for (int i = 0; i < nums.length; i++) {
      strNums[i] = String.valueOf(nums[i]);
    }

    // Sort using custom comparator
    Arrays.sort(strNums, (a, b) -> (b + a).compareTo(a + b));

    // Handle case where all numbers are zero
    if (strNums[0].equals("0")) {
      return "0";
    }

    // Build the result
    StringBuilder result = new StringBuilder();
    for (String str : strNums) {
      result.append(str);
    }

    return result.toString();
  }
```

```
}

public class Main {
    public static void main(String[] args) {
        Solution sol = new Solution();

        int[] nums1 = {10, 2};
        System.out.println(sol.largestNumber(nums1)); // Output: "210"

        int[] nums2 = {3, 30, 34, 5, 9};
        System.out.println(sol.largestNumber(nums2)); // Output: "9534330"
    }
}
```

Sample Output:

Input: nums = [10,2]

Output: "210"

Input: nums = [3,30,34,5,9]

Output: "9534330"
